

To whom it may concern:

About 3 years ago I took the plant manager job here in New Richland, Minnesota. Immediately I started evaluating all the different areas of the plant. Our maintenance supervisor, Alvin Morstad informed me of his lubrication plan with much enthusiasm. He told me of all the failures and issues he had in the past and how since switching to the Power Up Lubricants line of products the down time and failures have just stopped.

Our pellet mill is the heart of our plant. We had a major failure with a complete overhaul required and it was expensive with a lot of down time. At that point it was decided that we had to look at making this unit as reliable as possible. Our local Power Up Distributor paid us a visit and demonstrated the difference in the lubricants that we were using and the Power Up Lubricants. To say the least we were impressed and decided to go with the product.

The results have been very good for us. Previously we had to grease every 4 hours because the grease would just run out of the mill due to the steam that is used in making pellets. Since switching to Power Up food grade grease we now grease every 8 hours with substantially fewer pumps without any grease running out. This calculates to a 67% reduction of grease plus, it lowers our down time. This saves us time and money. The big savings is in the wear on this piece of equipment. We had the mill inspected for wear and it checked out in like new condition. So much like new, the inspector wanted to know what lubricant we were using because he'd never seen a machine check out so well.

Power Up food grade grease has proven to give us the performance and value that is needed to keep our plant running and producing a quality product and keep our costs down. I recommend Power Up Lubricants to anyone for the best preventative maintenance program available.
